

ABSTRACT

A global paging system and corresponding method are disclosed in which an originating user pages a receiving user in a different country without the paging message being broadcast in all areas. According to certain embodiments, the originating user E-mails a web site or server of the paging system paging information, with the server then transmitting the paging message over a packet-switched digital data network (e.g. the Internet) to a receiving or terminating web site or server located in the different country. In certain embodiments, the receiving user remotely inputs a designated country into the paging system so that when the receiving user is paged, the paging system first pages the receiving user in the designated country or area without broadcasting the paging message in other countries or areas.
